## Provide easy-to-understand personal hygiene guidance for your patients

Dental hygienists play a key role in influencing their patients' behavior regarding their oral hygiene. Verbal explanation of proper cleaning technique is quickly forgotten. New video technology helps demonstrate how hygiene should be done when the patient is alone at home. Personalized videos of the patient's own mouth and condition, showing the right implements and techniques are much more impactful than verbal instruction, 3D animations or educational leaflets.

The interest and motivation to care for their own oral health at home improves dramatically when the hygienist provides personal guidance with real video. This helps the patient understand the need for specific hygiene actions and how to use implements such as an electric toothbrush, interdental brush or dental floss.

Video dentistry also helps with the hygienist's own work. Showing and discussing problematic issues with colleagues is made easier. Documenting problematic cases for the dentist is faster and more efficient. It's also easier to show how the patient has progressed by reviewing videos from previous visits.

Providing personal dental education is easy with a combination of lightweight HD camera technology, easy-to-use recording software and a highly secure cloud server.

## Key benefits of using videos in personal dental hygiene guidance

There are many reasons to use videos with dental patients;

- **Exact details** of the patient's personal situation are shown
- **Patient motivation and confidence** improves
- **Your instructions** are understood better, and can be reviewed at home
- You provide **a unique and personal new service** for your patients

Recording videos and taking still images during the dental hygiene work is simple and easy. The small, lightweight camera is set up directly onto your loupe or mounted on your frames and the recording software is controlled with a foot pedal. You can share the video using an integrated cloud service. The patient receives the video as an email and can see it on a phone, tablet or any device.
